Project Proposal

      For my project I would like to design a program where the user can input two or three sets of data and have the program run a multiple regression analysis of the data and produce a graph of it. I would also like for it to produce different relationships in the data, such as the R squared, p value, t test, and f test. As

 an economics major, we regularly run regressions to look for correlations between sets of data as to be able to predict future occurrences in the data sets.
